Your plants are shipped in grower’s pots. Don’t be alarmed by their small size or lack of foliage. Once planted they may take 4-6 weeks, depending upon the weather and other environmental conditions, to start showing new growth. You can be assured that they will begin setting roots and start growing very soon after planting. Please plant as soon as possible, provide reasonable care, and be patient.

We urge you to plant your new arrivals as soon as possible. In the event planting must be delayed due to weather or other unforeseen circumstances, roll the plastic bag that is around the plant down and place in or near a bright window. Also, keep the soil in the pots moist. These are small pots that may need to be watered at least every other day.

The foliage on potted plants may appear wilted or yellow upon receipt. This is nothing to worry about. Water the plant thoroughly then gently remove any foliage that doesn’t “perk up”.

For maximum bloom make sure your bush isn’t shaded or crowded. Butterfly bushes do not perform well when crowded. Try to improve air circulation and make sure the bushes get at least 4 to 6 hours of sun a day to perform at their best.

Butterfly bushes can get very large and have a spread similar to their height; however, they are not invasive. Some states, such as Oregon, do consider the butterfly bush an invasive weed because of its rapid growth and reseeding in that area.

This shrub will perform well in a container the first season until it is moved to the garden in the fall where it should eventually remain. Summer Lilacs, as they are sometimes called, need minimal care.

PLANT WARRANTY

We warrant perennials for 1 year and annuals for 90 days from the time of the original shipment. If for any reason you are dissatisfied, we will replace your plant with a similar or comparable one, at no charge. If your replacement is not available or it is too late in the season to ship, it will reship the following shipping season.

CAUTION: Not all plant material is edible. Though most plants are harmless, some contain toxic substances which can cause headaches, nausea, dizziness, or other discomforts. As a general rule, only known food products should be eaten. In case of ingestion, please contact your local poison control center at once and advise them of the plant ingested.

Keep out of reach of children.

SOIL PREPARATION
Although these plants will perform well in average garden soils of all types, we recommend having your soil tested periodically by your local County Extension Office (www.csrees.usda.gov/extension or by calling 1-800-333-4636). These tests can determine if the soil needs any amendments to enhance your plants' growth and performance. See below for our recommended practice to improve your soil without any additional testing:

1. Spade or till the soil to a depth of 12-18 inches.
2. To provide nutrients and improve drainage, add organic matter to your soil by mixing in a 2 to 4-inch layer of dehydrated manure, garden compost, shredded leaves, and/or peat moss.
3. After active growth begins, periodically feed with a water-soluble fertilizer. Plants in containers need more frequent watering and feeding, especially when in active growth and bloom.

PLANTING INSTRUCTIONS

Important: Thoroughly rehydrate the plant and its surrounding soil before planting so it may properly adapt to its new location. We recommend submerging the root zone of the plant in a container of water for 2-3 minutes while you prepare for planting.

1. Remove and discard the clear plastic bag from around the plant.
2. After watering, separate the root ball from its pot by holding the plant upside down in one hand and gently squeezing the sides of the pot with the other. Do not yank on the stem; the plant should easily slide out of the pot with just slight pulling.
3. Prepare the root ball for planting by gently disturbing the roots with your fingers, fork, or gardening tool. Loosen any roots that have begun winding around the soil ball and prune any rotted or damaged roots. This will encourage the roots to begin growing outward into the new soil.
4. Dig a hole twice as wide and twice as deep as the plant’s root ball. Partially backfill the hole with soil and place the plant into the hole. The top of the root ball should be level with the ground surrounding the hole. Refill the hole with soil, firming the soil around the plant with your fingers. Check to be sure the plant is not planted too deeply. If it is, raise the plant carefully and refirm the soil.
5. Water thoroughly.

CONTINUING CARE

Adequate and consistent watering is essential during the plant's first year in your garden. Infrequent, long soakings of water that thoroughly saturate the soil surrounding the root zone are more effective than frequent light applications of water that may wet the top of the soil only.

Due to individual plant needs, geographical, and environmental conditions, a specific watering schedule is hard to define; however, as a rule of thumb you should not allow the soil to completely dry out. During periods of drought and extreme summer heat, you may need to water as often as every day.

Overwatering can be as damaging as under watering. Be sure that the area surrounding your plant does not become a water-holding bog and that there is adequate drainage to move excess water away from the plant.

WATERING

Keep the area around your plants free of weeds. Weeds compete with all plants for food, water, and light. Walk around the garden periodically and pull weeds, including the roots, as soon as you see them.

FEEDING

Feed your plants once every 2-3 weeks during the growing season with a water-soluble fertilizer. Discontinue feeding after September 1st so your plants can harden off for winter dormancy. Resume fertilizing when new growth appears in the spring.

MULCHING

Apply a 2-4 inch layer of shredded bark, compost or other organic mulch around your plants to promote moisture retention, maintain even soil temperatures, and to discourage weed growth.

WEEDING

Remove flower heads as soon as the flowers have faded in the summer to encourage continuous bloom. At the same time, remove unwanted or undesirable branches and cut out weak shoots, particularly those inside or toward the center of your shrub.

PRUNING

The time to protect your plants in the garden is after the ground has frozen. At that time, apply a winter mulch of evergreen boughs, straws or leaves to prevent lifting of the plant's roots during alternating periods of freezing and thawing.

Other than the above-mentioned mulching, Butterfly Shrubs do not need special winter protection. Even if they die back from a harsh winter, cut them back to the ... the roots. In Zones 2 through 4 the tops will die back in winter but new growth will appear from the roots in the spring.

CONTAINER SIZE

One plant per 12-inch or larger container.

CONTINUING CARE (Continued)

Although these plants will perform well in average garden soils of all types, we recommend having your soil tested periodically by your local County Extension Office (www.csrees.usda.gov/extension or by calling 1-800-333-4636). These tests can determine if the soil needs any amendments to enhance your plants' growth and performance. See below for our recommended practice to improve your soil without any additional testing:
